

## **ASET Science & Engineering Practices (SEP) Tool:** Using Mathematics and Computational Thinking

Indicate if a component is present using Y (yes) or N (no) and then, if it is present, fill in the right 2 columns.

A single lesson will most likely not address each of the components below.

ring of these components is not mean	t to indica	te they should be used in sequence, they are si	mply for reference.	
<b>Using Mathematics and Computational Thinking:</b> In both science and engineering, mathematics and computation are fundamental tools for representing physical variables and their relationships. They are used for a range of tasks such as constructing simulations; solving equations exactly or approximately; and recognizing, expressing, and applying quantitative relationships. Mathematical and computational approaches enable scientists and engineers to predict the behavior of systems and test the validity of predictions.

## ASET Grade Band Criteria (Grade Bands: K-2, 3-5)

## **Science & Engineering Practices**

**SEP 5: Using Mathematics and Computational Thinking:** Mathematical and computational thinking in K-2 builds on prior experiences and progresses to recognizing that mathematics can be used to describe the natural and designed world(s). In 3-5 they build on K-2 experiences and progress to extending quantitative measurements to a variety of physical properties and using computation and mathematics to analyze data and compare alternative solutions.

By the end of the grade band <u>students</u> will have had a structured opportunity to develop an understanding of each of these. Individual lessons or units should include opportunities for <u>students</u> to practice one or more of the following components ......

	K-2 Grade Band	3-5 Grade Band
1) Identify mathematical and/or computational representation(s) that can be used to interpret and make sense of phenomena or assess solutions to design problems	Students describe, measure, and/or compare quantitative attributes of different objects and display the data using simple graphs	Along with K-2 skills, students create best representations to support a phenomenon
<ol> <li>Apply mathematical and/or computational representation(s) of the phenomenon to identify relationships in the data and/or simulations</li> </ol>	Students use counting and comparing numbers to identify and describe patterns in the natural and designed world(s).	Along with K-2 skills, students organize simple data sets to reveal patterns that suggest relationships (e.g., cause and effect, structure and function, correlations)
3) Use analysis of the mathematical and/or computational representation(s) as evidence to explain phenomena or assess solutions to design problems	Students use identified patterns or quantitative data:  a. as evidence to explain a given phenomenon b. to compare two alternative solutions to a problem	Students:  a. describe, measure, estimate, and/or graph quantities such as area, volume, weight, and time to address scientific and engineering questions and problems  b. create and/or use graphs and/or charts generated from simple algorithms to compare alternative solutions to an engineering problem
